Education

The University of West Georgia

Jan 2022 - May 2024

- Bachelor of Science (CS)
- Certificate of Data Science

Awards

- Boyd Award of Excellence
- Dean's List

Skills

Programming Languages

- Python, C, C++, Fortran, CUDA, Rust, C#, ASP.Net, JavaScript, TypeScript, HTML, CSS, React, React Native, Java, MATLAB, SQL (MySQL, PostgreSQL)

Tools & Platforms

- TensorFlow, Scikit-learn, OpenCV, CMake, Git, CI/CD, Azure, AWS, Docker, Helm, Proxmox, Kubernetes, OpenMP, Blender

Other Skills

- Machine Learning, HPC, REST APIs, Agile (SCRUM), DevOps, Cloud Deployment, Software Testing

Activities & Outreach

- Vice President, Association for Computing Machinery
- Member, Upsilon Pi Epsilon (CS Honor Society)
- Presenter, Georgia Undergraduate Research Conference (AI Routing & Classification Systems)
- Contributor, UWG AI Lessons & Workshops
- Panelist, UWG STEM High School Outreach

Work Experience

Aptean

AI Engineer *(promoted from Associate AI Engineer)*

June 2025 - Current

- Build and maintain Agent Central, Aptean's agent platform within the AppCentral cloud suite, on a five-engineer team; re-architected it from a Django monolith to FastAPI and React/TypeScript with a provider abstraction layer supporting OpenAI, Claude, Gemini, and Gemma.
- Developed the platform's automatic agent selector for over 100 agents: evaluated TensorFlow neural classifiers and several retrieval approaches before landing on semantic similarity search over structured capability cards with an LLM-as-judge ranking step.
- Shipped a natural-language agent builder and internal Python CLI and agent builder used by teams across R&D, generating models, skills, prompts, tool configuration, and tests from plain-language descriptions.
- One of two applied-AI specialists in R&D: led agent and MCP workshops for audiences of 60–100 across multiple regions and guided 5–10 person product teams.

Aptean

Associate Automation Engineer

August 2024 - June 2025

- Built business process automations for HR and Support functions, including ticket resolution and hiring workflows, using Flowable and Azure Logic Apps, gathering requirements directly from stakeholders alongside a business analyst.
- Extended Flowable Work to support both Entra ID SSO and standard credential login by forking the vendor's Spring Boot services and Helm charts and serving each method at separate URL paths across Dev, QA, and Production environments.
- Initiated and rolled out engineering process standards for a seven-person team after repeated schedule slips: GitHub source control, Azure DevOps CI/CD pipelines, sprint planning, issue tracking, and shared project boards.

Projects

High-Performance Physics Engine - *GitHub*

September 2023 – Current

- Built a physics simulation engine in C/C++, CUDA, and Fortran under one CMake build, dispatching N-body gravity between Fortran CPU kernels and CUDA by problem size.
- Implemented octree broad-phase and OpenMP-parallel SAT narrow-phase collision detection with inelastic response and Velocity Verlet integration.
- Added dual CUDA/Fortran matrix backends, a unit test suite, GitHub Actions CI, and Python and Blender interfaces that bake simulated motion to keyframes.
